Treatment

After preoperative evaluation and after obtaining informed consent, he was operated under general anesthesia on 01-09-2022.

Operative Findings

-Indirect inguinal hernia present with dense adhesions with the cord. There was a sac of the level of deep ring with wide defect and omentum as the content.

He underwent Open right inguinal hernioplasty using 6x11 cm vypro mesh.
The postoperative period was free of major complications.

Condition at the time of discharge:

-The wound is healing. He is tolerating normal diet with normal bowel habits.
